Buyers are asked to commit to months of use on trust. The page should earn that trust before it asks for the commitment.

In short

The decision

The page sells a **₹1,439 tub** that lasts about **25 days**, but the pack label asks for a minimum of **3–4 months**. The real decision is roughly **₹4,800 and three months of daily use**, committed before any result is visible: a trust decision, not just a price objection. O

Who it is for

Urban Indian women, roughly 25–40, noticing early signs of ageing, shopping on mobile and sceptical of over-promising products. A Inferred from page positioning, not buyer data.

What stops her (ranked)

1 The evidence isn't believable
2 The real commitment is hidden
3 Checkout adds pressure

What I propose

Five interventions, ranked by ICE: **1** consistent evidence module (7.0) · **2** regimen-based pack selector (7.0) · **3** transparent price and offer block (6.7) · **4** suitability and safety panel (6.7) · **5** believable reviews (6.3).

Start with the evidence module: it fixes the credibility problem at the core of the decision, uses wording the brand has already approved, and the pack selector depends on it. Factual and compliance errors are fixed immediately, outside the ranking.

How it will be judged

Test 1 measures add-to-cart rate; **Test 2** measures revenue per visitor, with guardrails on purchase and COD conversion. Sample sizes need the company's data. **No results are claimed in this document.**

Contents

5	**Two A/B tests** Hypothesis, control, variant, metrics, guardrails, decision rule	PS 3 · Experiments
6	**Rollout, risks and data requests** Seven gated phases; data needed before launch	PS 5 · Implementation
7	**Evidence and references** Assumptions, items to verify, linked sources	PS constraints

PS deliverable 4, the responsive HTML prototype, is submitted separately.

How to read the tags

O observed on the page · E-IN Indian research or regulation · E-GL global research · A assumption · H hypothesis to test · V still to verify

She is deciding whether to trust a three-month regimen she cannot test first

Primary segment

Urban Indian women, roughly 25–40, noticing early signs of ageing

Notices	Fine lines, dullness, loss of firmness, brittle hair or nails
Wants	Visible skin, hair and nail results “from within”
Buys	Online, mostly on mobile; will pay a premium
Worries	Has been let down by over-promising creams; cannot see results before paying

O Title “Combat Signs of Ageing”; 5 of 6 benefit icons are about skin; testimonials mostly from metro women; listed under Beauty.

Her decision breaks into three questions

Question	What she needs to see	Friction
Will it actually work?	Evidence that agrees with itself; reviews that look real	Friction 1
Is it worth it, and how much should I buy?	The cost per day and the right pack for a full course	Friction 2 (and price clarity)
Is it right and safe for me?	Fish allergy, veg status, taste, delivery and returns	Suitability gap

A Price is weighed against her confidence that it will work and her willingness to persist, which is why I treat this as a **trust-and-commitment** decision rather than a price objection.

Secondary, needs-based segments

Visible-ageing buyers (mostly women 40+): “Will it make a visible difference?” · **Joint and active buyers** (men and women): “Is marine collagen right for joints, not just skin?” O The page’s only male testimonial says he assumed collagen was “female-only”. A Demographics are positioning, not proven buyer data.

Purchase journey: where she can stall, divert or leave

	1 Discover	2 Land on page	3 Judge credibility	4 Check suitability	5 Choose quantity	6 Check out	7 Use and reorder
Her question	“Where is the best price?”	“What is this?”	“Will it actually work?”	“Is it right for me?”	“How many tubs?”	“Can I pay without surprises?”	“Is it working?”
What she meets O	Google Shopping shows ₹1,367.05; the page shows ₹1,439	A “Spin to win exclusive coupons” pop-up opens over the page	Contradictory claims; 4.74★ with no low ratings	“Non-Veg” only in a spec table; “allergen-free” claim	1 tub ≈ 25 days; ~8 offers; packs priced linearly	OTP first; pre-ticked consent; error screen	Tub runs out before the label’s minimum
Might then A	Buy on a marketplace	Miss key facts	Discount every claim	Hunt for answers or leave	Default to one tub or defer	Abandon at peak intent	Stop before results
Response	Intervention 3	Next in queue	**Interventions 1, 5**	Intervention 4	**Interventions 2, 3**	**Baseline fixes**	Intervention 2

Dark stages carry the three priority frictions. Row 3 is a hypothesis about behaviour: no stage-level funnel data was available, so it is the first item requested from the company (page 6).

Three frictions sit closest to the decision: unbelievable evidence, a hidden commitment and a pressured checkout

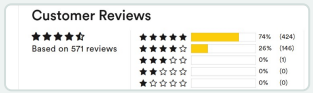

1 The evidence isn't believable

What she meets. "Backed by 20+ Clinical Studies" sits directly above "Claims are ingredient-based and not for the product". Results are promised in **4–8 weeks, 8–12 weeks, 12 weeks** and **3–4 months** in different places; absorption is **4x, 1.5x and 5x**. Even the nutrition panels disagree: **7.9 g protein (14.62% RDA)** per 8 g serving in the gallery, **7.45 g (16.20%)** on the back of the pack. O

Gallery image (left) vs back-of-pack image (right), same product page

Reviews. Brand site 4.74★ from 571 ratings with **no one- or two-star reviews**; several "Verified" entries contain only the product name. Amazon.in shows 4.2★ (1,537) with ~11% one- or two-star. O

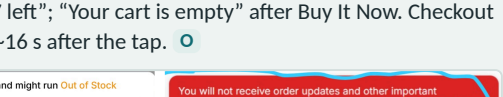

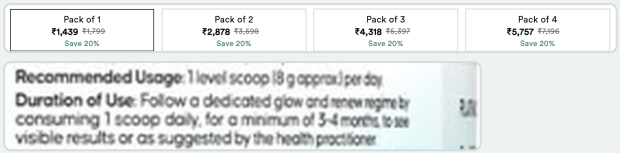

Why it matters. A A sceptic who spots one contradiction may discount every claim. E-IN 56% of Indian online shoppers find ratings positively biased; 52% say their negative reviews weren't published (LocalCircles 2024, 54,000+ responses).

Opportunity → one consistent, label-backed evidence story; reviews that look like real people wrote them.

2 The real commitment is hidden

What she meets. One tub lasts about 25 days; the label asks for 3–4 months. Packs of 1–4 are priced linearly and every one says "Save 20%", so committing to the course earns nothing extra. There is no subscription and no cost per day on the brand site. O

Also. Refunds only for damaged, defective or wrong items (48 h); "Value for money" is a negative Amazon.in theme. O

No low-risk start here. The page offers sachets "for easy, on-the-go use", but only tubs are sold on the site; Flipkart sells 6 sachets for ₹391. O

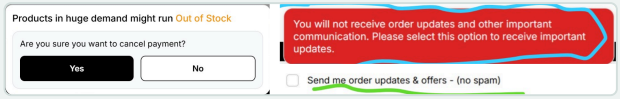

Instead of rewarding the course, a "Spin to win" coupon pop-up adds another offer to compare. O

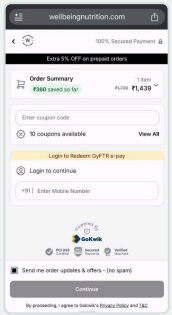

Why it matters. A She may buy one tub that runs out before the label's minimum, or postpone because the downside feels large.

Opportunity → show how long each pack lasts and what it costs per day, without forcing the bigger pack.

3 Checkout adds pressure and removes control

What she meets. A phone number and OTP before any delivery or payment option; one **pre-ticked** box bundling order updates with offers, which shows a red warning when unticked; an exit pop-up saying products "might run Out of Stock" while the page says "Only 13237 left"; "Your cart is empty" after Buy It Now. Checkout was usable ~16 s after the tap. O

Mobile checkout, 21 Oct 2026 O : login with phone number and OTP comes before delivery and payment options; "Send me order updates & offers" is a single box covering both transactional messages and marketing. In a fresh session the box was pre-ticked; unticking it triggers the red warning above.

Why it matters. A These are buyers who had already decided. E-IN The pop-up and warning resemble "false urgency" and "confirm shaming" in India's 2023 dark-pattern guidelines; DPDP consent standards apply from 13 May 2027. These are risks to review, not legal findings.

Opportunity → fix the compliance and bug items now (they are not experiments); simplify the rest later.

Why this order. Each friction was judged on how directly it could stop a purchase, how many visitors it affects, where it sits in the journey and how strong the evidence is. Frictions 1 and 2 define the decision itself; Friction 3 acts after the decision is made. The order of 1 and 2 is **judgement, not measurement**. Lower-priority frictions found: unclear final price (≈8 offer messages; best price only at payment), buried suitability facts, and a slow, crowded mobile page. Screenshots are my own captures (October 2026), cropped to remove personal details.

Five interventions, ranked with one ICE framework, with the evidence module first

ICE = (Impact + Confidence + Ease) ÷ 3, each scored 1–10

Impact: change to the main friction, if it works · **Confidence**: evidence for the problem *and* the fix, capped by the weaker · **Ease**: speed and approvals needed

Rules fixed before scoring

Score only phase 1 · score Impact on the main friction · break ties by Impact, then Confidence, then dependency · factual, safety and compliance fixes are not scored, they ship regardless.

#	Intervention	Phase-1 change	Why it could improve conversion	Not in phase 1 · depends on	ICE
1	**Consistent evidence module** Friction 1 (claims)	Below the benefit icons: one usage line from the approved label (“one 8 g scoop daily, minimum 3–4 months”); one nutrition panel matching the approved label; no absorption multiplier unless substantiated; ingredient studies kept separate from product lab reports; quick facts	Removes the contradictions that make a sceptic discount every claim. E-IN FSSAI: product claims need human studies	No new timeline or efficacy figures. Needs approved label text and nutrition panel; regulatory review	**7.0** 7 · 6 · 8
2	**Regimen-based pack selector** Friction 2 (commitment)	Packs relabelled “1 tub · 25 days” … “4 tubs · 100 days · Recommended”; “about ₹58 a day” on every pack; single tub stays default; **no new discount**	Makes the hidden decision (one tub won’t last the course) visible; hesitant buyers can still start small. E-GL Baymard: show price per unit	Discount, starter pack, subscription: later tests. Needs Intervention 1 live	**7.0** 7 · 6 · 8
3	**Transparent price and offer block** Price clarity	Headline ₹1,439 (the COD price); “₹1,367 when you pay online” beneath; one “Offers that apply” block with stacking rules; free shipping shown	Same price from search result to payment; no coupon hunting. E-IN Prepaid is only 41% of Indian orders (ClickPost)	Delivery date later. Needs stacking rules V; same price in checkout	**6.7** 6 · 7 · 7
4	**Suitability and safety panel** Suitability	Under the price: non-veg symbol, “Made from fish”, fish and shellfish allergy, doctor note, best-before date, replacement policy, link to vegan collagen	Answers her first questions from label wording; unsuitable buyers are redirected. E-IN 29.4% of women never eat non-veg (NFHS-5)	No species unless confirmed V. Needs an owner for best-before dates	**6.7** 5 · 7 · 8
5	**Believable reviews** Friction 1 (social proof)	Rating summary plus dated, representative reviews near the buy box; a “critical” filter; every review published, negatives included; verified-order prompts	Swaps a too-perfect score for signs real people wrote the reviews. E-GL Purchases peak at 4.2–4.5★ (Spiegel)	No marketplace reviews on site. Needs moderation; reward any honest rating	**6.3** 6 · 7 · 6

Why Intervention 1 goes first

1. **Core of the decision:** if she doesn’t believe it works, pack and price never matter.
2. **Verified information:** it reorganises approved label wording, so Ease is 8.
3. **The pack selector depends on it:** “4 tubs · 100 days” needs one timeline, not four.
4. **Wins the tie-break:** both 7.0, equal Impact and Confidence, so dependency decides.

A prioritisation judgement, not a claim that it has the largest effect.

The other tie, and what sits outside

3 and 4 (both 6.7): the price block has higher Impact (6 vs 5): it affects most visitors, while the panel is decisive for a subset.

Baseline (ships now): fix logos, false scarcity, “allergen-free”, consent box, exit pop-up, cart error. **Next in queue** (5.7): fewer pop-ups, faster mobile page.

Why not discount the 4-tub pack now?

I can’t price it without margin data, and testing framing and discount together would hide which one worked. If duration labels alone raise multi-tub orders, the brand keeps its margin. If not, the discount becomes Test 3, with margin per visitor as a guardrail.

Arithmetic: 21 ÷ 3 = 7.0 · 20 ÷ 3 = 6.67 → 6.7 · 19 ÷ 3 = 6.33 → 6.3 · 17 ÷ 3 = 5.67 → 5.7. Scores are judgement on a written rubric, not measured effects. Source: my Revised CRO Interventions document.

Two proposed A/B tests, run one after the other. Neither has been run, so no result is claimed.

	Test 1 · Consistent evidence module	Test 2 · Regimen-based pack selector (framing only)
Hypothesis H	Replacing contradictory claims with one label-approved evidence module raises the add-to-cart rate, without lowering purchase conversion.	Labelling packs by how long they last, with the cost per day and no price change, raises revenue per visitor, without lowering conversion or COD conversion.
Control (A)	Current product page after the baseline fixes, captured and frozen for the test	Current pack selector ("Pack 1–4", "Save 20%"), on the page where Intervention 1 has shipped
Variant (B)	Evidence module below the benefit icons; everything else identical	Duration labels; "about ₹58 a day"; 4 tubs "Recommended"; single tub default; same prices and offers
Primary metric	**Add-to-cart rate** = assigned visitors who add the product or tap Buy It Now ÷ assigned visitors who view the product page	**Revenue per visitor** = net product revenue from orders by assigned visitors ÷ assigned visitors (captures conversion and order size together)
Secondary	Evidence-section engagement; lab-report opens; dose and collagen-type questions to support and the AI assistant	Share of orders with 2+ tubs. On its own this is **not** proof of extra revenue: it may shift timing or replace reorders
Guardrails	Purchase conversion must not fall beyond an agreed margin (removing bold claims could cut impulse buys); claim- and safety-related complaints	Conversion rate (sticker shock from seeing the full course); COD conversion (most Indian orders are COD)
Supports the hypothesis	Add-to-cart significantly higher, the gain at or above the agreed practical threshold, and purchase conversion within its margin	Revenue per visitor significantly higher and above the threshold, with conversion and COD conversion within their margins; delivered revenue checked too
Fails, or harmful	No significant difference: not supported (shipping it for compliance is a separate decision, not a test win). A drop, or a breached guardrail: rejected; roll back	Flat revenue per visitor with a higher multi-tub share: not supported. A breached guardrail: keep control and iterate
Validity risks	Sale events; other tests running at the same time; novelty effect; tracking gaps because Buy It Now skips the cart; page edits mid-test	Offer changes mid-test; pack-size tracking errors; COD orders refused at delivery; reorder effects appear only after the test window (track days 25–40)

Sample size and duration: method, not invented numbers

Test 1 uses a two-proportion calculation: baseline add-to-cart rate p_1, the smallest lift worth detecting, significance level α and power. **Test 2** uses a difference in means: the standard deviation of revenue per visitor (zeros included), the smallest worthwhile change, α and power. Revenue is skewed, so outlier handling is fixed in advance.

Duration = required visitors ÷ daily eligible visitors, rounded up to whole weeks. V None of these inputs is known yet. α = 0.05 and power = 0.80 are conventions to agree with the business, not facts about this page.

Decision rule, written before launch

- Randomise by visitor (persistent ID), 50/50, on first product-page view.
- Check the traffic split first; a sample-ratio mismatch makes the result invalid.
- Ship only if the primary metric improves significantly **and** by a practically worthwhile amount, with every guardrail inside its margin.
- A higher rate without significance is **inconclusive**, not a win and not a failure. Record it either way.
- Fixed horizon; stop early only for harm, broken tracking or a ratio mismatch. Avoid sale periods and overlapping tests.

Discounts, a starter pack and subscriptions are separate later experiments with their own guardrail (margin per visitor), never mixed into Test 2.

Rollout runs in seven gated phases. Nothing launches until claims are approved and tracking matches real orders.

1 Fix now
Baseline factual, safety and compliance fixes

Web, regulatory, GoKwik

Gate: sign-off; each fix verified live

2 Validate
Confirm label wording, lab-report scope, prices, offer rules and review data

Marketing, R&D, regulatory, ops

Gate: every claim traceable; open questions closed

3 Instrument
Track page view, add-to-cart, Buy It Now, order, payment method, pack size

Analytics, engineering

Gate: events match orders; baseline and variance known

4 Build and QA
Build the variant and assignment; test mobile and desktop, flicker, prices

Product, engineering, QA

Gate: QA passed; dry run shows no ratio mismatch

5 Launch
Small ramp to catch errors, then 50/50 to the planned sample

Product, analytics

Gate: no errors; guardrails in limits

6 Decide
Analyse as pre-registered; document the result either way

Analytics, product, finance

Gate: decision rule applied as written

7 Monitor
Guardrails, complaints, repeat purchase and reviews over 60–90 days

Product, customer experience

Gate: roll back on a breach

Phase 1 ships independently. Phases 2–7 run for Test 1; its winning page becomes Test 2's control. A proposed sequence, not a calendar: owners are functions, and no dates or durations are committed without company input.

Data to request from the company

Needed before launch	Why it matters
Funnel data by stage and device	Confirms where buyers actually leave
Baseline add-to-cart, conversion, revenue per visitor, AOV, COD share and conversion, with variance	Sample size; guardrail limits
Daily traffic to this page; mobile/desktop split	Test duration
Pack-level sales mix	Test 2 baseline
Offer-stacking rules, payment prices, margin per pack	Accurate price copy; margin check
Approved label wording and nutrition panel, lab reports, claim substantiation, allergen declaration	Interventions 1 and 4 must be verifiable
Experiment tool; access to checkout events	Can the test be measured end to end?
Owner for batch best-before dates; review-platform data	Interventions 4 and 5
Can be collected during testing	
Repeat-purchase timing (days 25–40) · support and AI-assistant queries · COD refusals · mobile speed score · sale calendar	

Principal risks

Risk	Mitigation
Short-term dip after removing bold claims	Conversion guardrail; staged ramp; rollback
Regulators read the remaining claims differently	Regulatory review at the Phase 2 gate
Third-party checkout limits consent and price changes	Confirm GoKwik's options in Phase 1
Tracking gaps (Buy It Now skips the cart)	Reconcile events with orders before launch
Sale periods or overlapping tests distort results	Run tests in sequence; check the calendar

After each test

Positive: roll out, keep monitoring guardrails, move to the next test.

Negative or guardrail breached: roll back and record why; revisit the hypothesis before redesigning.

Inconclusive: treat it as "no evidence either way". Keep a compliance-driven change if it is needed anyway, and say clearly it was not a test win.

Responsible functions are proposals; the company's actual owners and timelines were not available.

What is observed, what is assumed, and where every external figure comes from

Assumptions and items to verify

Item	How to resolve
A The primary segment is women 25–40	Customer mix data
A Buyers default to one tub and stop near day 25	Pack mix; repeat-purchase timing
A First-time buyers are more sceptical	Segment test results by new vs returning
A One mobile recording (one device, 4G) is representative	PageSpeed and field data
V Protein per serving: 7.9 g (gallery) or 7.45 g (pack)?	Company provides the approved nutrition panel
V Do the member price and online discount stack?	Marketing confirms
V "4 tubs · 100 days" covers only the 3-month minimum	Confirm wording with label owner
V Fish species; why sachets are advertised but not sold on the site	Brand confirms
V Does the cart countdown reset on reload?	Reload test on two devices
V All prices, ratings and counts (observed 21 Oct 2026)	Revalidate before presenting

How to read the evidence

Most external research here shows that a **problem matters to Indian shoppers**. None of it shows that these specific fixes raise conversion on this page. That gap is what the two tests are for, and why no Confidence score is above 7.

Primary observations: the brand product page, policy pages and GoKwik checkout; Amazon.in, Nykaa, Flipkart and Google Shopping listings; one mobile screen recording. All captured 21 Oct 2026.

Regulatory points (FSSAI, CCPA, DPDP) are framed as **compliance risks to review**, not legal conclusions.

Still to capture: refund-policy page, "Clinically Proven" badge, the "4x" and "1.5x" claims.
